

PERIPHERAL EQUIPMENT FOR A LINKY® CONCENTRATOR

CAHORS offers equipment tailored to each situation for the installation of the data concentrator in underground or overhead network infrastructures.

Main Features

For public distribution MV/LV substations in a cabin or masonry, the data concentrator is installed on a board or in a box for compact workstations. The LV network connection is made using the power supply kit.

From overhead substations, the concentrator is installed in a board-equipped box. This box is mounted to a LV network, preferably near the MV/LV substation.

Power is supplied through overhead connections.

CAHORS offers special equipment for an underground network concentrator or for cold regions.

Benefits

- Diversity of solutions
 - Adaptable to all configurations
 - Simplified implementation
-

Uses

- All MV/LV network structures
- Urban and rural
