

TEMPORARY ELECTRICAL COLUMN

The temporary column provides a collective supply of power to users during renovation work on the electrical column.

Main Features

A temporary electrical column must meet the following three objectives:

- ensure the safety of people and property
- protect the various delivery points
- temporarily provide individual bypasses without disrupting the future column (use must be limited over time)

Depending on the type and duration of the work, CAHORS offers 4 different schemas for the temporary column, based on three technologies: circuit breaker distributors and fuse connectors.

Benefits

- Cost-effective solution
 - Reusable products
 - Personal safety and protection
-

Uses

- Collective
- Tertiary
